

**DIGITAL CAN-BUS WIPER SWITCH**  
This sends a digital signal from the wiper switch, which you cannot modify with a Rain Tracker.

To install a Rain Tracker, you must access the wires going to the wiper motor winding terminals. locate the Rain Tracker control module under the dashboard, and run wire to the wiper motor windings-- you will need to extend the wires from the RainTracker, and go through the firewall.

**To Install using CAM Feedback:**

Splice into the vehicles CAM wire, BRN/GRY as shown above. Connect the spliced wire to the BRN wire of the RT-50A module. The BRN wire is located on the 3 position connector which connects to module on the opposite side of the 10 position connector. The other 2 wires on the 3 position connector can be removed.

Connect all other wires as outlined in the Rain Tracker instructions

**WARNING:** Do NOT mix parts from the RT-50 with parts from the RT-50A. The sensor and module are not interchangeable. The wiring is the same, but the parts are not!
