

For Immediate Release

## New Rain Tracker Makes Rain Sensing Wipers Available for RV's

Eden Prairie, Minnesota (May 28, 2009) - Ever notice how often you adjust the wiper speed during wet weather? Rain and road conditions change constantly, and even with intermittent wipers the driver must be constantly switching the wiper speed to match the conditions. To relieve the driver of this source of fatigue, many luxury cars have come equipped with rain sensing wipers for more than a decade. Just released, the new Rain Tracker model RT-50A has made rain sensing wipers available for RV's, fire trucks, ambulances, and other specialty vehicle applications. Opto-Electronic Design, Inc has sold Rain Trackers for aftermarket applications for some time, and was winner of the 2001 SEMA best new product award. This new model, however, is the first rain sensing wiper control system compatible with the thicker windshields of RV's.

With the Rain Tracker wiper control system, a tiny sensor on the inside surface of the windshield shines beams of invisible, infrared light through the windshield to look for raindrops. A control module ties into the existing wiper system with a few wires. The system constantly adjusts the speed of the wipers, from completely off, through intermittent, slow, and high speeds. Result: the system kicks the wipers up to high speed when that big 18-wheeler passes you, and back down to intermittent when the rain lets up. You never have to reach for the wiper switch. The existing wiper control is not affected. The Rain Tracker can be installed as a retrofit or integrated into the vehicle on an original equipment basis. MSRP \$99.
